

These solutions enhance public safety by enabling immediate access to emergency services, helping communities meet the law's requirements for timely intervention and crisis management.

ENSURING COMPLIANCE WITH LAURA'S LAW

Key Improvements for Compliance

- Hospitals must maintain lighted two-way communication technology with duress alarms at main entrances, emergency, ambulance, and commonly used exterior doors.
- Facilities must have 24/7 video/audio monitoring of exterior entrances and emergency drop-off areas, with recording storage for 14 days.
- All entryways must be well-lit and include clear directions to the emergency department.
- Emergency department signage must be visible at night and in bad weather.
- Hospitals must ensure accessibility for patients with all levels of physical, sensory, and cognitive function.

What does this mean?

Hospitals with emergency departments must comply with the specific wayfinding, signage, and security standards outlined in 105 CMR 130.127 and the Department's guidelines. These requirements aim to create a safer, more accessible environment for patients seeking emergency medical attention.

Compliance with Laura's Law requires reliable emergency communication systems to ensure rapid response and intervention in crisis situations.

Code Blue Solutions can support compliance by providing advanced emergency blue light phone systems equipped with real-time monitoring, remote diagnostics, and seamless communication capabilities.
